

By now, you should have heard it already. Google launched a new browser called Chrome, which is available for download from <http://www.google.com/chrome> . My first instinct is to run all our apps through the brand new browser. So, this post kinda act like a test post. And, congratulation to google, all our component works smoothly on Chrome!.

Having a new browser is always tricky, for web developer like us, yet another browser we need to test it against, and testing does take a lot of time. On the other hand, everyone loves to see a better browser. IE sucks and microsoft weren't serious enough to enhance it. Firefox, as good as it is, are known to be extremely greedy when it comes to memory. Sudden lockups are common in Firefox and somehow we all learn to live with it.

Now, google, with its massive programming firepower gives us Chrome with tons of promises. It is still very early to tell, but so far, I am liking it.
